Running the program each week

Each week is designed with five maths lessons so that you can do it each day. Different days have different types of lessons to make sure that students experience the kind of thinking that they need to continue growing in maths. The types of lessons include:

- At-home investigation: This is a hands-on task where students explore a new idea before they are taught that skill. They need to come up with an idea to try to solve the problem, try out their idea, decide if it worked or not, try again if needed, and explain what they did. If your child has time with your teacher with a webcam, the teacher will generally be doing this lesson with your child. This is the lesson that will require the heaviest input from you to help your child think through an idea and generally requires the use of some hands-on materials that are listed in the information page.
- Connecting lesson: This type of lesson has questions that lead students to develop their
 ideas and learn a new skill. It should be fairly easy for a student to do, but you will need to
 be available to read the question to your child as needed, encourage them to think further,
 and make sure that they complete the work. Most of these lessons will include 10 minutes
 of practising number operations or concepts through activities or games.
- Interleaved practise lesson: This type of lesson provides 8-10 questions from different areas of maths so that students practise remembering what they have previously been taught. Some of the questions may not be easy for your child, so feel free to help whenever you see them struggling.
- **Generalising lesson:** This lesson contains some extension material for use if your child found the week's lessons too easy. *If you would prefer*, you can spend this lesson playing more of the number games that are included in the connecting lesson or giving your child time to complete any of the lessons that they have not yet done.

Getting help

The website above will have answers to frequently asked questions as well as videos to help you successfully teach your child at home. If you have further questions or need support, please contact your child's teacher directly using the contact details that they have provided to you. If they can't answer your questions, they will contact the B2FMaths@Home team directly to get an answer within 3 days.

What you need to know this week

Week overview

This week we are teaching the concept of Length. In upper primary, this means measuring accurately in centimetres and metres, as well as millimetres where appropriate. It also means calculating the perimeter (length around the outside of a shape). Finally, students move on to converting between metres, centimetres, millimetres and kilometres. Please note, there is a video on the webpage to help you understand this concept.

Students need to work out:

- A metre is the base unit for length measurement. We know this because there is not a prefix in front of the word metre (e.g. *centi*metre, *milli*metre).
- All of our measurements involve using multiples of ten.
- Cent means 100th (there are 100c in \$1). That means that 100cm = 1m.
- Milli means 1000th. That means that 1000mm = 1m. It also means that 10mm = 1cm.
- Perimeter is a measure of length. It is the distance around the outside of a 2D shape or 3D object.

We are also hoping that students will learn:

- One length can be written in different units (e.g. a wall length of 2.4m would be recorded as 2400mm by a builder as they work in millimetres)
- To compare lengths, we need to make sure that we are using the same units.

You will need the following objects:

• A ruler or measuring tape

Monday: At-Home Investigation

You will need:

- A measuring tape or ruler
- Clear space along the floor wherever possible

Steps:

- 1. Make sure you have read "What you need to know this week" so that you know what to emphasise with your child.
- 2. Read the sheet to your child. Ask for their ideas on how to solve the problem. Don't give your opinion just yet on their ideas, even if they are clearly wrong.
- 3. Make sure that you try out their ideas first before you try to help them come up with a better plan. This is important because then they will know why their idea didn't work.
- 4. Help your child think about what worked and what didn't, then come up with a new plan if needed.
- 5. Encourage your child to draw or write answers to the questions on the page.
- 6. Discuss what your child found out with them. Keep in mind the ideas from the "What you need to know this week" section so that you can ask questions that are appropriate to the issues identified.
- 7. We will be coming back to measuring perimeter again later in this program, so don't worry too much if today didn't quite work.
- 8. If your child found this task easy, ask them to convert the perimeter to centimetres or millimetres. There is a video on the website to demonstrate converting between units of measurement.

At-Home Investigation

Come up with a plan to measure the perimeter of your lounge room and your bedroom

My pl	an:	answer	these	questions
-------	-----	--------	-------	-----------

• Look at the lengths that you will have to measure for each room. What problems can you see? Come up with a plan for measuring the length of each wall without having to move your furniture.

• How will I make sure that I am measuring accurately when there is furniture in the way? What would happen if I didn't measure straight along?

Carry out my plan: follow these steps and answer the questions

• Measure each room and calculate the perimeter. Explain how you did it in the space below and give the final measurement for each.

Extend your learning: follow this step and answer the question How would you write the perimeter of each room in centimetres? How about millimetres?

Tuesday: Connecting lesson

You will need:

• A ruler that shows centimetres.

Steps:

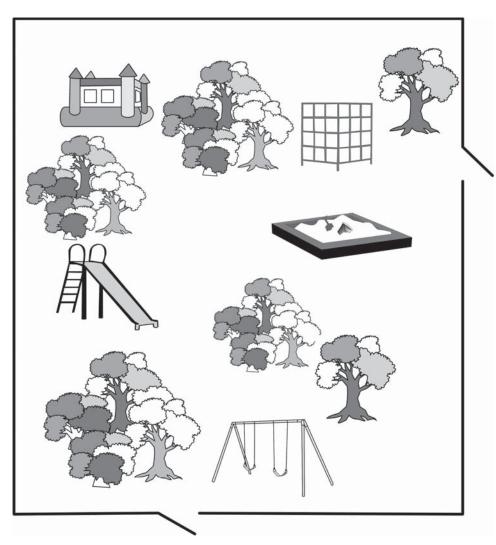

- 1. Make sure you have read "What you need to know this week" so that you know what to emphasise with your child.
- 2. Read the sheet to your child. Ask for their ideas on how to design a path.
- 3. Encourage your child to think about how they can calculate the length of their path without having to measure the whole way (each line is 3cm, so count up how many lines were used and multiply by 3).
- 4. On the second page, encourage your child to think about the words, "path" and "perimeter", working out that perimeter is the path around a shape or object.
- 5. Revisit the thinking that you did yesterday with your child. Now that they have a better understanding of perimeter, what would they change?

PROBLEM 18: MEASURING PERIMETER

A garden is pictured below. Planners are working out the best way to make a path through the garden (gate to gate) past all the play equipment. They must use straight lines 3m long. Design a path through the garden and work out how long it is. Answer the questions that follow.

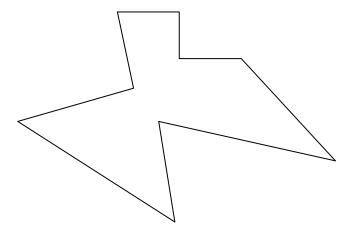

Our garden uses the scale 1cm = 1m

Draw a path through the garden from gate to gate using straight lines. How long is your path? How did you work it out?

Now join your path back up to the start instead of going out the second gate. Use a different colour. The length of this path is called the perimeter. Work out the perimeter of your revised path. What is it and how did you work it out?

The following shape has a perimeter too. Work out what you think the perimeter is and explain how you found it.

Communicating:

How did you work out the perimeter? What operations did you use?

Understanding:

If you had a different shape, how would you work out the perimeter? How do you know that this is the right way to work out the solution?

Manipulation problems:

If a square had a side of 5cm, what would its perimeter be? How did you solve it?

If a regular hexagon had a side of 8cm, what would its perimeter be? How did you solve it?

Teacher initials:

Date:

Problem solving / T&R:

- o Problem solved with minimal or non-mathematical prompting
- Some leading questions were used to prompt thinking
- o Solved after explanation
- Did not work out solution
 N/A- not a novel problem

Reasoning / Comm.:

(verbal, written, working and equations, or visual representations)

- Clearly and logically reasonedEasily understood
- o Understood with some interpretation needed
- o Some gaps but on topic

Understanding / Reflect:

- o Connected manipulation problems to previous questions and answered
- Connected manipulation problems to previous questions with some
- prompting, and answered correctly

 o Answered once the similarities to previous questions had been pointed out
- Had some problems in answers but was on the right track

 O Did not answer appropriately
- Student not observed

Wednesday: Connecting Lesson

This lesson allows your child to practise and consolidate what they have learned about perimeter over the past two days.

Number practice: Multiplication facts

Ask your child to complete one of the multiplication grids at the bottom of this page. Be aware that this might take a considerable period of time the first time around. Hopefully in a few weeks you will find that the time taken is much shorter.

Worksheet task: 15-20 minutes

You will need a ruler. This lesson is following on from what your child learned yesterday about with perimeter.

Make sure that your child **explains out loud** how they calculated the perimeter of each shape as this means that they will be more likely to remember it later.

At the end of this lesson:

Your child has now had 3 opportunities to try calculating perimeter. You will need to decide if they have mastered this concept or not. If they can, then on Friday do the extension task which involves converting between units of length. If they are having some trouble or forgetting the process, use the time on Friday to practise perimeter again.

Multiplication Practise:

Х	3	4	5	6	7	8	9
3							
4							
5							
6							
7							
8							
9							

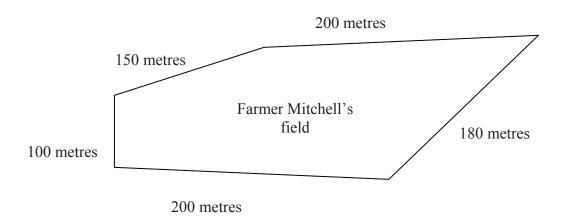

Record your time here for the 49 questions:

Mark your answers using a calculator or with an adult. Circle any that are wrong.

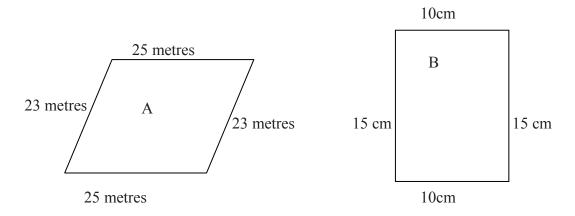

E4. Measuring boundaries

Farmer Mitchell needed to find the distance around his paddock so that he could fence it. He didn't have anything long enough to reach around the outside, but he did know the length of each side of the field. Below is a diagram showing his field. Use it to help you answer the following questions.

- 1. Farmer Mitchell worked out that the **perimeter** around his field was 830 metres. How did he work this out?
- 2. How did he work out what the **perimeter** was?
- 3. Use the same method to work out the **perimeter** for the following shapes:

- 1. What do you think **perimeter** might mean?
- 2. How could you check? Go and check your understanding of what **perimeter** means.
- 3. Are you right?
- 4. How would you work it out what the **perimeter** was for other shapes?

Thursday: Interleaved Practice Questions

Why we are using mixed up questions:

In this lesson your child will be reviewing a range of skills that they have learned previously. Each question is unrelated to the previous question, because we want your child to have to *think hard* about what to do. Mixing up questions like this, rather than just practising related questions, has been shown in research to improve student retention of concepts by 60% over a 4 month period.

What to expect:

Your child will probably have forgotten how to complete quite a few of the questions. If needed, change the numbers in each question to make them easier because this will still require your child to think hard and remember a process. If they still can't work it out, feel free to show them, but try using different numbers rather than the exact same question. There are answers to each question on the website in case you get stuck.

Interleaved practise

Number:

- 1. Complete the following number sequence: 3, 6, ___, __, 15, ___, 21
- 2. 12 478 + ____ = 13 623
- 3. Read this number and say it: 2 423 048. Write it in words. How many millions, thousands, hundreds, tens and ones does it have?
- 4. What change would you get from \$50.00 if you purchased a t-shirt for \$27.80? Show two different combinations of dollars and cents that you might receive.
- 5. Share 48 counters equally to show halves. How many other ways could you share the counters? Draw them and describe the groups you have made.

Measurement/Geometry:

- 6. Find 4 objects that would be measured in kilograms. Find 4 objects that would be measured in grams. List them in order from heaviest to lightest.
- 7. What time is it? What time will it be in an hour and half? Write both times using 24-hour time.
- 8. Draw what the next shape in this sequence would look like. Describe how you worked it out.

Chance/Data:

9. What could the weather be like tomorrow? List as many possibilities as you can. Write them in order from most likely to least likely.

Friday: Connecting Lesson

You will need to decide between the following options:

- Child found the perimeter work easy: Watch the video on the website about converting units of length and complete the activity sheets provided. You will need a calculator for this lesson.
- Child found the perimeter work hard: practise this skill again, particularly for rectangles.

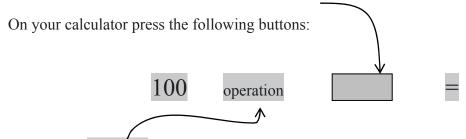

E12. Converting between units for length

Examine the pattern below and work out what operations were used to change between units for length.

Pattern: centimetres to metres

- 1. How many centimetres are in a metre?
- 2. Put the answer for question one in the box below.

Choose any operation from $+ - x \div$

You should keep trying different operations until you get 1 as the answer.

3. Which operation worked?

Now try out your operation on these to check if you get the right answers:

154cm = 1.54m

267cm = 2.67m

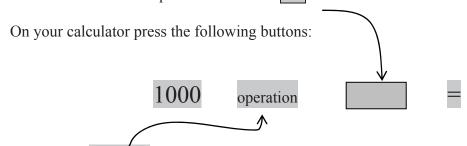

521cm = 5.21m

893cm = 8.93m

4. What do we do to change from centimetres to metres?

Pattern: millimetres to metres

- 1. How many millimetres are in a metre?
- 2. Put the answer for question one in the box below.

Choose any operation from $+ - x \div$

You should keep trying different operations until you get 1 as the answer.

3. Which operation worked?

Now try out your operation on these to check if you get the right answers:

1534mm = 1.534m

2525mm = 2.525m 5598mm = 5.598m

8275mm = 8.275m

4. What do we do to change from millimetres to metres?

Pattern: metres to kilometres

- 1. How many millimetres are in a metre?
- 2. Put the answer for question one in the box below.

On your calculator press the following buttons:

Answer from question 1

Choose any operation from $+ - x \div$

You should keep trying different operations until you get 1 as the answer.

3. Which operation worked?

Now try out your operation on these to check if you get the right answers: 1534m = 1.534km 2525m = 2.525km 5598m = 5.598km 8275m = 8.275km

4. What do we do to change from metres to kilometres?

Complete the following statements showing how to change units:

To change:

From centimetres to metres

From metres to centimetres

From millimetres to metres

From metres to millimetres

From metres to kilometres

From kilometres to metres

BACKWARDS QUESTION:

Your teacher will now draw a curved line on the blackboard for you to measure. You need to record how long it is in millimetres, centimetres and metres. Do you need to measure it three times? Explain how you could work it out:
